

# HOUSE PRICE PREDICTION

```
# House Price Prediction without NumPy or scikit-learn

print ("==== House Price Prediction =====")

# User Input

area = float (input ("Enter House Area (sq. ft): "))

bedrooms = int (input ("Enter Number of Bedrooms: "))

age = int (input ("Enter House Age (years): "))

# Simple Price Formula

price = (area * 5000) + (bedrooms * 50000) - (age * 60000)

# Display Result

print ("\n----- Prediction Result -----")

print ("House Area:", area, "sq. ft")

print ("Bedrooms:", bedrooms)

print ("House Age:", age, "years")

print ("Predicted House Price: ₹", price)
```

## OUTPUT:

Enter House Area (sq. ft): 1200

Enter Number of Bedrooms: 3

Enter House Age (years): 5

===== House Price Prediction =====

Enter House Area (sq.ft): 1200

Enter Number of Bedrooms: 3

Enter House Age (years): 5

----- Prediction Result -----

House Area: 1200.0 sq.ft

Bedrooms: 3

House Age: 5 years

Predicted House Price: ₹ 6150000.0

Calculation:

Area Price =  $1200 \times 5000 = ₹60,00,000$

Bedroom Price =  $3 \times 50,000 = ₹1,50,000$

Age Deduction =  $5 \times 60,000 = ₹3,00,000$

Predicted Price =  $60,00,000 + 1,50,000 - 3,00,000 = ₹61,50,000$  (6150000.0)
